FOR IMMEDIATE RELEASE

Wheel Cleaner Option Available for Residue Manager

Yetter Farm Equipment has introduced a new option for moving residue from planting rows in tough, direct planting and strip-tillage fields.

The Yetter 2967 Residue Manager can be fitted with a new **Wheel Cleaner** to prevent tall residue from wrapping. The wheel cleaner can also provide depth control in fields with extreme residue and varying tillage and soil conditions.

The new wheel cleaner can be retrofitted onto the front of existing residue manager wheels or can be ordered as an option on new units. It attaches easily to the front, bolt head area of the wheel at the hubcap.

The wheel cleaner joins other innovations available for the Yetter Residue Manager. Those innovations include **bearing shields** to prevent residue buildup around the bearing hub behind the wheel.

In addition, Yetter offers a **“Floating” Residue Manager** with a torsion spring that allows the unit to float up when encountering field obstacles and contour changes. This reduces planter bounce and seed displacement. Yetter also provides **Single Wheel Residue Managers** for narrow row planters and drills.

“Growers are clearly seeing the row warming and quick emergence benefits of the residue manager for direct seeding operations (like no-till or strip-till),” said Gene Chenoweth of the Yetter Research and Development Department. “They want to be able to run them in a wide variety of

tough field conditions, too. The wheel cleaner cuts down on the wrapping of stringy residue from hay and other forage fields. It also provides depth stability.”

Retail price of 2967-455 wheel cleaners is \$21 each.
